

Project Design Phase

Proposed Solution Template

Date	30 June 2026
Name	Nadin Surya S
Project Name	Meeting Room Booking System using ServiceNow App Engine Studio
Maximum Marks	2 Marks

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Meeting rooms in most organizations are still booked manually through emails, phone calls, or shared spreadsheets. This unstructured process frequently results in double-bookings, miscommunication, and disputes over room availability. There is no centralized record of bookings, no automatic validation of date/time conflicts, and approvals depend on an individual administrator's availability – making the process slow, error-prone, and difficult to track or audit.
2.	Idea / Solution Description	A custom Meeting Room Booking System built on the ServiceNow platform using App Engine Studio. Employees submit a booking request through a simple online form (employee details, room, date, start/end time, purpose). A Client Script validates that the end time is later than the start time, a Business Rule automatically sets the initial status to "Pending", and a Flow Designer workflow updates the booking status and triggers an automated email notification. Administrators review, approve, and mark bookings as completed through the same application, with a dashboard and reports providing full visibility into booking activity and room utilization.
3.	Novelty / Uniqueness	• Built entirely on a low-code ServiceNow platform (App Engine Studio), enabling rapid development and easy customization without heavy custom coding • Real-time client-side validation prevents invalid time entries before submission, rather than rejecting them after the fact • End-to-end automation – from status assignment to email notification – driven by Flow Designer, removing manual intervention at every stage • Unified dashboard combining booking status, room-wise usage, and booking trends in a single view for administrators
4.	Social Impact / Customer Satisfaction	• Eliminates the frustration of double-booked or unavailable rooms, reducing workplace conflict and wasted time • Gives employees instant, transparent status tracking instead of waiting on manual confirmations • Reduces administrative workload, freeing facility staff to focus on higher-value tasks • Promotes better utilization of shared office resources, supporting more efficient and organized workplace operations
5.	Business Model (Revenue Model)	As an internal enterprise productivity application, the solution does not generate direct revenue but delivers strong operational value: reduced administrative overhead, fewer scheduling conflicts, and better room utilization translate into measurable cost and time savings. For organizations offering this as a packaged ServiceNow solution, the model could extend to a Software-as-a-Service (SaaS) / subscription-based licensing model for other companies using ServiceNow, or a one-time implementation and customization fee for deployment in client instances.
6.	Scalability of the Solution	• Built on ServiceNow's scalable cloud architecture, allowing the application to support growing numbers of employees, rooms, and locations without redesign • New room types, locations, or buildings can be added simply by extending the Room Name choice list and related configuration • Additional modules – such as resource booking (projectors, equipment), calendar/Outlook integration, or mobile access – can be layered on using the same Flow Designer and App Engine Studio framework • Reporting and dashboard components scale naturally with data volume, supporting multi-department and multi-site rollouts
